

EDUCATION

University of Guelph

Bachelor of Computing – Computer Science (Co-op), Honours

Sep 2022 – Aug 2027 (Expected)

Guelph, ON

SKILLS

Languages

Python, JavaScript, TypeScript, Java, SQL, C, C++, HTML / CSS

Technologies

Git, Docker, AWS, Node.js, PostgreSQL, Nginx, Unicorn, Redis, ServiceNow, Grafana, Power BI

Frameworks / Libraries

Django, Flask, Express, React, SQLAlchemy, Pandas, Selenium, Jest

WORK EXPERIENCE

Software Engineer Intern

Jan 2026 – Present

TD Bank

Toronto, ON

- Designed and implemented an automated ServiceNow workflow that replaced a weeks-long manual group-linking process. This eliminated repetitive configuration work and standardized entitlement mapping across eGRC, resolving brittle name-based dependencies during organizational changes.
- Built Python-based data integration scripts and pipelines connecting ServiceNow, internal systems, and Microsoft SQL Server to support automated reporting and dashboarding for the eGRC team.
- Automated ServiceNow script exports to GitHub using Python and the ServiceNow API, improving version control; developed Jest test suites that reach 80%+ coverage across targeted business logic.
- Developed JavaScript-based ServiceNow business rules, scheduled jobs, and workflow automations supporting TD's internal risk and compliance operations.

Software Developer Intern

May 2025 – Aug 2025

Health Espresso Inc.

Oakville, ON

- Built a secure real-time messaging microservice using TypeScript, NestJS, WebSockets, and AWS S3 to support encrypted practitioner-patient communication with file attachments, read receipts, and role-based access controls.
- Created a Python Selenium regression suite for critical user/admin flows in the web portal using deterministic test data and explicit waits; cut manual QA by 80% and caught 15+ pre-release bugs.
- Developed an AWS Bedrock-powered text extraction microservice using API Gateway, Lambda, and PostgreSQL to convert unstructured clinical notes into structured patient demographics while maintaining sub-2-second latency and low inference costs.

Data Engineer Intern

Sep 2024 – Dec 2024

Johnson Electric

Hamilton, ON

- Developed a Python-based ETL pipeline to automate ingestion and transformation of factory production data into PostgreSQL, replacing manual reporting workflows and enabling scheduled processing across manufacturing systems.
- Built internal Django web applications to digitize factory-floor workflows, replacing paper-based forms and enabling operators to submit production reports, track issues, and report broken tools through centralized web interfaces.
- Designed SQL-driven Grafana and Metabase dashboards to visualize machine utilization, downtime, and production efficiency trends for manufacturing operations monitoring.

PROJECTS

PCTracker | Python, Django, MySQL, Nginx/Unicorn | pctracker.ca

- Developed a comprehensive PC hardware platform that integrates real-time eBay pricing data, allowing users to search for instant price comparisons, build custom PC configurations with price estimates, and analyze component benchmarks. Deployed on a VPS using Nginx and Unicorn.
- Utilized eBay's API with OAuth tokens to automate the extraction of real-time pricing data for second-hand computer hardware, efficiently processing up to 5000 API calls daily.
- Created a dynamic database system that stores detailed specifications and pricing for thousands of individual components, manages compatibility relationships between parts, and allows users to build and save custom PC configurations through personal accounts.
- Implemented secure authentication using Django auth with two-factor authentication for protected user accounts.

GeoTuring | TypeScript, Node.js, Socket.IO, PostgreSQL, Express, React, Redis | geoturing.com

- Developed a deployed real-time social deduction game where anonymous players chat with humans or AI agents, then infer whether the opponent is human, and guess their geographic origin or the underlying AI model.
- Built WebSocket-based matchmaking, live chat rooms, session timers, game-state synchronization, and scoring flows using TypeScript, Node.js, Express, and Socket.IO.
- Integrated OpenRouter-powered AI agents and PostgreSQL persistence for session history, guesses, scores, and AI model metadata. Deployed full-stack services across Railway.
