Education

University of Guelph — **Sep 2022 – Dec 2027 (Expected)**
Bachelor of Computing – Computer Science (Co-op), Honours — Guelph, ON

Skills

Languages	Python, JavaScript, TypeScript, Ruby, Java, SQL, C, C++, HTML/CSS
Technologies	Git, Docker, AWS, Node.js, PostgreSQL, Nginx, Gunicorn, Redis, Power BI
Frameworks / Libraries	Django, Flask, Ruby on Rails, Express, React, NestJS, SQLAlchemy, Pandas, Selenium, Jest

Experience

Clio — **Sep 2026 – Present**
Software Engineer Intern — Toronto, ON

- Identified and fixed an **API authorization flaw** in **Ruby on Rails** by correcting feature-gating permission checks, preventing users without billing permissions from modifying client billing settings.
- Expanded **automated regression coverage** with end-to-end, API request, and unit tests for time-entry workflows and billing code enforcement, validating rejection of entries missing required legal billing codes.
- Removing feature flags and staged rollout logic for **4 legal billing features** to make them standard product functionality, validating regional access controls to prevent unintended feature activation.

TD Bank — **Jan 2026 – Aug 2026**
Software Engineer Intern — Toronto, ON

- Developed **Python tooling** to export and organize ServiceNow scripts in **GitHub**, driving **team-wide adoption** of VS Code, Git versioning, code search, and GitHub Copilot; added Jest suites covering **80%+ of targeted business logic**.
- Automated a ServiceNow workflow that eliminated **2 weeks of manual access-control relinking** during organizational changes and group renames.
- Implemented **Python ETL pipelines** from ServiceNow to **Microsoft SQL Server**, powering **Power BI dashboards** for deployments, developer activity, and system changes.

Johnson Electric — **Sep 2024 – Dec 2024**
Data Engineer Intern — Hamilton, ON

- Built **internal Django applications** that replaced paper-based factory workflows, enabling operators to submit production reports, track issues, and report broken equipment.
- Created **Python ETL pipelines** that loaded factory production data into **PostgreSQL** and powered **Grafana and Metabase dashboards** tracking machine utilization, downtime, and production efficiency.

Projects

PCTracker | *Python, Django, PostgreSQL, Nginx/Gunicorn* — pctracker.ca

- Built and deployed a full-stack PC hardware price-tracking platform covering **33,000+ components across 8 categories**, with saved builds and used-market pricing, using **systemd-automated weekly catalog refreshes** on a Linux VPS with Nginx/Gunicorn.
- Integrated the **eBay Browse API** with OAuth2 and built trimmed-mean outlier filtering and denylist rules to produce reliable used-market prices within a **5,000-call/day** quota while persisting historical price snapshots for trend tracking.
- Mapped PassMark benchmarks to **6,700+ components** via **fuzzy model matching**, enabling performance rankings.

GeoTuring | *TypeScript, React, Node.js, Express, Socket.IO, PostgreSQL, Redis* — geoturing.com

- Built and deployed a **real-time social-deduction game** where users chat 1:1 with either a human or AI, then identify their opponent and guess their geographic origin or AI model.
- Engineered a **server-authoritative Socket.IO game engine** with matchmaking, automatic AI fallback, synchronized timers and game state, and session recovery across reconnects.
- Designed **OpenRouter-powered AI opponents** across GPT, Claude, Gemini, and Grok with randomized personas and prompt-injection resistance; implemented PostgreSQL/JSONB persistence and **Redis-backed leaderboards**.
